

Canei Subirats
Renovations, simply complex.

ERP · OPERATIONS & SETUP GUIDE

Bringing your ERP into operation

Infrastructure, the day-to-day process, who does what (RACI), and a step-by-step setup you can follow even with no technical background — from empty account to running the whole job from lead to paid invoice and a five-star review.

PREPARED FOR
Canei Subirats, S.L.

DOCUMENT
Go-live runbook v1

READ TIME
~20 minutes

What's in this guide

Read it top to bottom the first time. When you set the system up, keep section 6 open — it is the numbered checklist. Anything marked **later** is not needed on day one.

1 • The system at a glance	p.3	6 • Go-live: step-by-step setup	p.8
2 • Infrastructure (the moving parts)	p.4	7 • Daily operation runbook	p.11
3 • How it's built (architecture)	p.5	8 • Backups, security & data protection	p.12
4 • The operating process	p.6	9 • Next steps & roadmap	p.13
5 • Roles & RACI matrix	p.7	Glossary of terms	p.14

The one-sentence version. Your ERP is a website (an application) that your team opens in a browser on the office PC or a phone on site. It stores everything in a secure database, and it turns one data entry — the customer and the quote — into the quote PDF, the project, the purchase orders, the invoice, the reminders and the review request, automatically.

How to use the interactive demo alongside this guide

Everything described here can be tried today, with no installation, on the public demo:

- **End-to-End Journey** — enter your own project and run all 13 steps; photos and documents are filed into a downloadable project folder.
- **Control Tower** — the owner's dashboard (pipeline, money, alerts).
- **Quote demo** and **Backend** — the quoting screen and the API responses.

stefangruber001.github.io/OpenProject2/

SECTION 1

The system at a glance

What you are putting into operation, in plain terms.

WHAT IT IS

A web application

A private website only your team can log in to. Nothing to install on each computer — it opens in Chrome, Edge or Safari, on desktop and on the phone.

WHAT IT DOES

Runs the whole job

Lead → site visit → estimate → quote → acceptance → project → purchasing → execution → invoice → collection → supplier payment → close → review. One thread.

WHERE THE DATA LIVES

A secure database

A PostgreSQL database with **row-level security** — each company's data is isolated. Backed up daily. You own it and can export it at any time.

WHAT MAKES IT DIFFERENT

A factory, not a fork

Adding a second company or changing tax rules is **configuration** (data), never re-programming. Legal rules are dated and the reason is saved on each document.

The promises the software keeps for you

- **Enter data once.** The accepted quote becomes the project, the invoice and the emails — no re-typing.
- **Money is exact.** All amounts are handled in whole cents; VAT is decided by the legal rule and the justification is stored on the invoice (e.g. the reduced 10% renovation rate, art. 91.Uno.2.10^o).
- **Invoices are immutable and gap-free.** Numbered in sequence and sealed in a chain (SHA-256); a correction is a *rectificativa*, never an edit.
- **Profit, not just turnover.** Budget → committed → actual → revenue → margin → cash, per project.
- **Documents carry your identity.** Quotes, invoices and emails all wear the Canei logo and colours.

Honest limits on day one. A few connections need your credentials before they are switched on: real email sending, Verifactu/AEAT (legally required from 2027, not before), bank statement import, and card payments. Until then the software produces the document or draft and logs it — it never sends or files anything on its own. These are listed in section 9.

Infrastructure — the moving parts

The picture below is the whole system. You rent three or four small cloud services; they talk to each other over the internet. There is no server in your office to maintain.

PART	WHAT TO RENT (RECOMMENDED)	WHY · ROUGH COST
The application host	Vercel (free/Pro) — or any Node host	Runs the website; deploys automatically from the code. ~€0-20/mo.
The database	Neon or Supabase (managed PostgreSQL)	Stores all data with backups & isolation. ~€0-25/mo.
The code	GitHub (private repository)	Where the software lives; already set up. Free.
Domain optional	Any registrar (e.g. erp.caneisubirats.com)	A friendly web address. ~€12/yr.
Email later	Microsoft 365 (Outlook) or SMTP	To send emails & save drafts to Outlook. You likely have this.
Payments later	Stripe	Card / online payment links on invoices. Pay per transaction.

Plain-English takeaway. You are not buying servers. You create a few online accounts, paste some settings, and press deploy. Total starting cost can be under €30/month.

SECTION 3

How it's built (and why that matters to you)

You don't need this to operate the system — but it explains why changes are cheap and safe. The software is built in **layers**. Knowledge about Spain and about renovations lives in the upper, swappable layers; the core at the bottom knows nothing about any country or trade.

What this buys you

- A **second company** = a new configuration file, ready in minutes.
- A **tax-rate change** = a dated rule update; old invoices keep their old rule.
- Your **branding & wording** are data — no code change to restyle.

How quality is protected

- Automated checks run on every change (tests, boundaries, linters).
- A rule forbids Spanish/tax knowledge from leaking into the core.
- Every change is versioned in GitHub and can be rolled back.

SECTION 4

The operating process

The 13 steps your team runs for every job. The blue markers show where the software does the work **automatically** from the data you already entered.

⚙️ = document generated automatically · ✉️ = email drafted for you · 📷 = photos captured on site

STEP	WHAT THE OPERATOR DOES	WHAT THE SYSTEM DOES AUTOMATICALLY
1 Lead	Type the customer & the enquiry.	Opens a lead with a next action; starts the project folder.
2 Site visit	Take photos on the phone, jot notes/measurements.	Files photos & notes into the “02 Site visit” folder.
3 Estimate	Confirm rough scope.	Produces an order-of-magnitude figure.
4 Quotation	Pick chapters & quantities (catalogue-first).	Totals it, keeps optionals separate, makes the quote PDF .
5 Acceptance	Mark accepted (tick any optionals taken).	Freezes the version; drafts the acceptance email + PDF.
6 Project	—	Turns the quote into a project with a frozen baseline.
7 Purchasing	Raise purchase orders to chosen suppliers.	Commits cost against each chapter; flags over-budget.
8 Execution	Book supplier bills as they arrive.	Tracks actual vs budget per chapter (margin warning).
9 Invoicing	Confirm the invoice.	Applies the VAT rule, seals & numbers it, makes PDF + email .
10 Collections	Record the receipt when paid.	Allocates it; drafts a reminder if overdue.
11 Supplier payments	Pay bills on due dates.	Shows cash out vs cash in.
12 Close	—	Final margin & profit summary per chapter.
13 Review request	Send the request.	Drafts a branded review email with your Google link.

Lean by design. Of the 13 steps, six need only a click; the rest are short data entries. Everything the operator types is reused downstream — nothing is entered twice.

SECTION 5

Roles & responsibilities (RACI)

R = does the work · **A** = accountable / signs off · **C** = consulted · **I** = kept informed. Roles map to the permissions already built into the system (Owner, Administration, Operations), plus your external gestor and IT partner.

ACTIVITY	OWNER	ADMIN.	OPERATIONS	GESTOR	IT PARTNER
Lead capture & qualify	I	R	A	·	·
Site visit & photos	·	I	A/R	·	·
Quotation & pricing	A	R	C	·	·
Acceptance & project open	A	R	I	·	·
Purchasing / POs	I	C	A/R	·	·
Execution & supplier bills	I	R	A	·	·
Invoicing	A	R	·	C	·
Collections & reminders	I	A/R	·	·	·
Supplier payments	A	R	I	C	·
Tax filing (IVA/IRPF, Verifactu)	A	C	·	R	·
User accounts & permissions	A	R	·	·	C
Hosting, deploys & backups	I	I	·	·	A/R
Data protection (GDPR)	A	R	I	C	C

If you are a small team, one person can hold several roles — the point is that every activity has a clear **A** (one person accountable). The “IT partner” can be an occasional external contractor; day-to-day operation needs no IT.

Go-live: step-by-step setup

Follow these in order. Each step says **what to do** and **why**. Where you must copy a setting, it looks like `THIS`. You do **not** need to understand the code — you are creating accounts and pasting values. Budget about half a day. If a step feels technical, your IT partner can do Part A once in ~1 hour.

Part A — Stand up the system (one-time, technical)

1 Create the accounts

Go to each site and sign up (email + password): **GitHub** (github.com — you already have the code here), **Vercel** (vercel.com, “Continue with GitHub”), and a database at **Neon** (neon.tech) or **Supabase** (supabase.com). All have free tiers.

2 Create the database & copy its address

In Neon/Supabase click *New project*. When it finishes, copy the **connection string** (starts with `postgres://...`). Keep it private — it is like a key to your data.

3 Connect the app to GitHub in Vercel

In Vercel: *Add New* → *Project*, choose the `OpenProject2` repository, framework “Next.js”. Don’t deploy yet — first add the settings in step 4.

4 Paste the settings (environment variables)

In Vercel → *Project* → *Settings* → *Environment Variables*, add: `DATABASE_URL` = the address from step 2; `UI_LANG` = `es` (or `ca` for Catalan, `en` for English). These tell the app where the data is and which language to show.

5 Create the tables (migrate)

Once, run the database setup: `pnpm install` then `pnpm db:migrate` (your IT partner runs this from the code, with the same `DATABASE_URL`). This builds the empty tables. Nothing to decide — just run it.

6 Deploy

Press **Deploy** in Vercel. In ~2 minutes you get a web address like `canei-erp.vercel.app`. Open it — the app is live. (Optional: point `erp.caneisubirats.com` to it under Vercel → *Domains*.)

7 Prove it works

From the code, run `make demo`. It builds a sample quote and two invoices and checks the seals — if it prints green, the engine is healthy. This is the “smoke test”.

Part B — Make it yours (configuration, no coding)

8 Confirm the company details

Check the company file `tenants/diorka/tenant.yaml`: legal name, CIF, address, logo colours, invoice numbering, IVA/IRPF profile. These are already set to Canei Subirats — verify the CIF and banking once your gestor confirms them.

9 Load your catalogue & suppliers

Enter your usual chapters/items and prices, and your suppliers with their prices. This is what makes quoting “pick, don’t type”. Start with your 20 most common items; add more over time.

10 Create the user accounts & roles

Add each team member and give them a role: **Owner**, **Administration** or **Operations** (permissions are already defined). The owner can do everything; operations can capture visits and purchasing but not, say, change tax settings.

Part C — Optional connections (turn on when ready) later

11 Email & Outlook drafts

Provide your Microsoft 365 / SMTP details so emails can be sent and saved to the Outlook Drafts folder. Until then the app still produces the branded email and a downloadable Outlook draft.

12 Payments, bank & tax

Add **Stripe** for pay-online links; connect the bank for statement import; and, ahead of 2027, complete the **Verifactu/AEAT** certification with your gestor. Each is a self-contained switch-on and is not needed to start operating.

Daily operation runbook

The rhythm once you are live.

Every day

- Capture new leads and book visits.
- On site: photos + notes on the phone.
- Turn accepted quotes into projects (one click).
- Book supplier bills as they arrive.
- Send drafted invoices & reminders after a glance.

Every week

- Review the Control Tower: pipeline, margins, overdue.
- Chase overdue invoices (reminders are pre-drafted).
- Pay supplier bills due this week.
- Send review requests for finished jobs.

Every month

- Export the ledger for your gestor (CSV).
- Check margin-by-chapter for lessons on pricing.
- Confirm the backup ran (section 8).

If something looks wrong

- Nothing is deleted — invoices are immutable; use a *rectificativa*.
- The app can be re-deployed to the previous version in minutes.
- Contact your IT partner; the data is safe in the database.

Golden rule. Enter each fact once, at the step it first appears. The system carries it forward. If you find yourself re-typing, there is probably a button that already has it.

Backups, security & data protection

Backups

- Managed Postgres (Neon/Supabase) takes **automatic daily backups**; keep 7–30 days.
- Once a month, export a full copy (the app supports JSON/CSV export) and store it off-site (e.g. company OneDrive/Drive).
- Twice a year, do a **restore drill**: confirm a backup actually opens.

Access & security

- Each person has their own login; roles limit what they can do.
- The database has **row-level security** — data is isolated per company.
- Never share the `DATABASE_URL` or passwords; store them in the host's secret settings, not in email.
- Turn on 2-factor login on GitHub, Vercel and the database.

Data protection (GDPR / LOPD)

- You hold customer names, addresses, photos — treat them as personal data.
- Only collect what you need; keep a simple record of processing.
- Be ready to export or delete a customer's data on request.
- Your hosts (EU regions available) act as processors — keep their DPAs on file.

Legal / fiscal

- Invoices are gap-free and sealed; VAT rule & justification are stored on each one.
- Documents render in Spanish (es-ES); a Catalan label set can be switched on.
- **Verifactu** is mandatory from 2027 — plan the certification with your gestor in good time.

Next steps & roadmap

What to do right after go-live, and what is queued.

Do first (week 1–2)

- 1. Complete Part A & B of section 6; run one real job end-to-end with a friendly customer.
- 2. Load your top catalogue items and suppliers so quoting is fast.
- 3. Confirm CIF, bank and invoice-numbering with your gestor; update the company file.
- 4. Turn on email so invoices and reminders can actually go out (or keep using Outlook drafts).

Queued (turn on when it pays off)

CAPABILITY	STATUS & WHAT IT NEEDS
Real email / Outlook drafts	Needs Microsoft 365 or SMTP credentials. Today: branded draft + downloadable .eml.
Verifactu / AEAT filing	Legally required 2027; needs certificate + gestor sign-off.
Bank statement import (N43)	Cheapest cash-visibility win; upload file or connect aggregator.
Card / online payments (Stripe)	Adds “pay online” to invoices; pay-per-use.
Gestor export (A3 / Holded / Sage)	Confirm your gestor's preferred format; then one-click export.
Mobile app shell (offline site visits)	PWA packaging for weak-signal sites; the web app already works on phones.
Owner consolidated view (multi-company)	When a second company is added — configuration only.

Adding a second company is configuration, not a rebuild: a new company file plus its catalogue, ready in well under an hour. That is the whole point of the “factory”.

Glossary

Application (app)

The website your team logs into to run the business.

Host / Vercel

The service that runs the app on the internet.

Database / PostgreSQL

Where all data is stored, safely and with backups.

Environment variable

A private setting (like `DATABASE_URL`) pasted into the host, not into the code.

Deploy

Publishing a new version of the app — one button; reversible.

Migration

Creating/updating the database tables. Run once at setup.

Tenant / configuration

Your company set up as data (name, logo, tax profile) — no coding.

Baseline

The frozen budget copied from the accepted quote; everything is measured against it.

Committed vs actual

Committed = ordered (POs); actual = billed by suppliers.

Rectificativa

A correcting invoice — invoices are never edited or deleted.

Verifactu

Spain's anti-fraud invoicing regime, mandatory from 2027.

RLS (row-level security)

Database rule keeping each company's rows isolated.

Questions? Keep this guide with your company file. The interactive demo mirrors every step described here, so you can rehearse the whole process before go-live — and after, it is the fastest way to train a new team member.
